December 6, 2018

Introduction

Outline

- Challenge on *combinatorial design*
- What is it?:
  - ▶ existence or non-existence
  - ▶ representation
  - ▶ construction

What is Steiner Triple System

(Definition) Steiner Triple Systems (STS)

is an ordered pair (S, T) (a *design*) where S is a finite set of *point/symbol* and T is a set of subsets of 3-symbol in which all possible pair of S are contained **once and only once**.

What is Steiner Triple System

> ## (Definition) Steiner Triple Systems (STS)
>
> is an ordered pair (S, T) (a *design*) where S is a finite set of *point/symbol* and T is a set of subsets of 3-symbol in which all possible pair of S are contained **once and only once**.

More formally:

- define S such that $|S| = v$
- then $T = \{\forall \{a, b, c\} \in S \times S \times S\}$
  such that $\forall a, b \in S \times S \ a \neq$
  $b \quad \sum_{\forall \{x,y,z\} \in T} (\mathbb{I}_{\{a,b\} \in \{x,y\}} + \mathbb{I}_{\{a,b\} \in \{y,z\}} + \mathbb{I}_{\{a,b\} \in \{z,x\}}) = 1$

More compact way to define STS by define the *order v* of STS by $v = |S|$

Examples of STS

$$S = \{a\}, T = \emptyset$$
$$S = \{a, b\}, T = \emptyset$$

Examples of STS

$$S = \{a\}, T = \emptyset$$
$$S = \{a, b\}, T = \emptyset$$
$$S = \{a, b, c\}, T = \{\{a, b, c\}\}$$

Examples of STS

$$S = \{a\}, T = \emptyset$$
$$S = \{a, b\}, T = \emptyset$$
$$S = \{a, b, c\}, T = \{\{a, b, c\}\}$$
$$S = \{a, b, c, d\}, T = \emptyset$$
$$S = \{a, b, c, d, e\}, T = \emptyset$$
$$S = \{a, b, c, d, e, f\}, T = \emptyset$$

Examples of STS

$$S = \{a\}, T = \emptyset$$
$$S = \{a, b\}, T = \emptyset$$
$$S = \{a, b, c\}, T = \{\{a, b, c\}\}$$
$$S = \{a, b, c, d\}, T = \emptyset$$
$$S = \{a, b, c, d, e\}, T = \emptyset$$
$$S = \{a, b, c, d, e, f\}, T = \emptyset$$
$$S = \{a, b, c, d, e, f, g\}, T =$$
$$\{\{a, b, c\}, \{c, d, e\}, \{e, f, a\}, \{f, b, d\}, \{a, g, d\}, \{e, g, b\}, \{c, g, f\}\}$$
$$...$$

Balanced incomplete blocks design

(Definition) $(v, k, \lambda) - \text{BIBD}$

v, k and λ be positive integers such that $v > k \geq 2$. A balanced incomplete block design is a *design* (S, T) such that satisfy these properties:

1. $|S| = v$
2. $\forall t \in T \quad |t| = k$
3. for all distinct pairs are contained in exactly λ blocks (t)

Why **balanced** and **incomplete**?

balanced they share the same property (2)

incomplete by reason of $v = |S| \quad > \quad k = |t| \ \forall t \in T$

What is Steiner Triple System 2

λ blocks (t) of $(v, k, \lambda) - \mathrm{BIBD}$ iff $\lambda = 1$, $k = 3$.

$(v, k, \lambda) - \mathrm{BIBD}$

v, k and λ be positive integers such that $v > k \geq 2$. A balanced incomplete block design is a *design* (S, T) such that satisfy these properties:

1. $|S| = v$
2. $\forall t \in T \quad |t| = k$
3. $\forall s \in S$ is contained in exactly λ blocks (t)

What is Steiner Triple System 2

λ blocks (t) of $(v, k, \lambda) - \text{BIBD}$ iff $\lambda = 1$, $k = 3$.

$(v, k, \lambda) - \text{BIBD}$

v, k and λ be positive integers such that $v > k \geq 2$. A balanced incomplete block design is a *design* (S, T) such that satisfy these properties:

1. $|S| = v$
2. $\forall t \in T \quad |t| = k$
3. $\forall s \in S$ is contained in exactly λ blocks (t)

All theory from BIBD is shared too in STS

[Kirkman, 1847]Existence proof

Theorem

A STS of order v **exists** *if and only if $v \equiv 1, 3 \ mod(6)$*

Proof.

$(\Rightarrow)$We know that all possible pairs are $\binom{v}{2}$, and by definition these pairs are partitioned (non-overlapping and union make all) into 3-element groups. Thoose groups are $|T| = \frac{\binom{v}{2}}{3} = \frac{v(v-1)}{6}$. Then for $\forall x \in S$ can be defined $T(x) = \{t \ \backslash x\} | x \in t \in T\}$. So if an $x \in S$ is fixed and then for every set t which contain x we remove the point x then we carry out $v - 1$ point partitioned in *2-element* set. As we can't make 2-element partition from a group of *odd* element, $v - 1$ is *even*! So v is *odd* and it's equal to say $v \equiv 1, 3, 5 mod(6)$. The $\frac{v(v-1)}{6}$ is not an integer for every $v \equiv 5 mod(6)$. As a result STS $\Rightarrow v \equiv 1, 3 \ mod(6)$ $\qquad \square$

Existence proof 2

$(S, T) : |S| = v \land v \equiv 1, 3 \; mod(6) \Rightarrow STS(v)$

In addition we suppose:

- each dinstict pair of S belongs to *at least* one triple in T
- $|T| \leq \frac{v(v-1)}{6}$

Proof 1.

(Absurd) Assume the contrary and make a list L as follows: for every pair write down the triple with which it is associated. Then $|L| > \binom{v}{2}$ as there exists a pair with towo triples. Now since each triple is counted by exactly three pairs so $|T| = |L|/3 > \frac{\binom{v}{2}}{3}$, a contradiction. $\qquad \square$

Proof 2.

For each distinct pair of S belongs to at least one triple and if the number of triples is less than or equal to the right number of triples, then each pair of sumbols in S belongs to exactly one triple in T. □

Proof 3.

We costruct 2 methods to prove sufficient costraint to the Theorem by showing 2 methods:

- Bose construction
- Skolem construction

□

Representation
of STS(v)

How to represent

- through display each 3-set of T and S ($\{a, b, c, d, e, f, g\}$, $\{\{a, b, c\}, \{b, d, e\}, ..., \{d, f, g\}\}$)
- through a *complete graph*

Figure: A complete graph of order $v = 7$

Example

Why a focus on representation?

- we talk about combinatorial design (display somehow somethings)
- help to design algorithm

Figure: A complete graph of order $v = 7$

Focus on

How to choose a proper partition of the graph ?

Example

First non-dummy: STS of *order* 7

Figure: Fano plane

Figure: Building methods on STS(7)

Construction methods

How to create

- Bose method
- Skolem
- $6n + 5$
- With quasigroups with holes
- Wilson
- $2n + 1$
- $2n + 7$
- Even-Odd

Bose construction

We need first define:
idempotent commutative quasigroups of order $2n + 1$

But first: recap

(Definition) latin square of order n

is an $n \times n$ array where each row and column contains all symbols $\{1, ..., n\}$ exactly one time.

1	3	2
2	1	3
3	2	1

Table: Latin square of order 3

(Definition) Quasigroup

A *quasigroup* of *order* n is an algebric structure, a pair $(Q, \circ)$ where $|Q| = n$ and $\circ : Q \times Q \to Q$. $\forall a, b \in Q$ then $\exists! x, y$ (unique!) to the equations $a \circ x = b$ and $x \circ a = b$.

An examples of quasigroup are $(Z_n, -), (Z_n, +)$.

Quasigroup and latin square

Theorem
The multiplication table of a quasigroup is a Latin square

A quasigroup $(G, \circ)$ is a latin square of order $v = |G|$:

1	3	2
2	1	3
3	2	1

Table: Latin square of order 3

$\circ$	1	2	3
1	1	2	3
2	3	1	2
3	2	3	1
Table: Quasigroup of order 3

Quasigroup and latin square

Theorem

The multiplication table of a quasigroup is a Latin square

A quasigroup $(G, \circ)$ is a latin square of order $v = |G|$:

1	3	2
2	1	3
3	2	1

Table: Latin square of order 3

$\circ$	1	2	3
1	1	2	3
2	3	1	2
3	2	3	1

Table: Quasigroup of order 3

A $(Q, \circ)$ is said:

idempotent $\forall i : 1 \leq i \leq |G|$ the cell (i, i) contains α such that $\alpha \leq i$

commutative $\forall i, j : 1 \leq i < j \leq |G|$ the cell (i, j) contains the same of (j, i)

Theorem

idempotent commutative quasigroups exist **if and only if** *they have odd order.*

Great! We look at the half of all possible

Construction method of CI quasigroup

1. Let v be the order of quasigroup, take $(Z_v, +)$ where $+$ is the addition in Z_v.

2. For all element $i := i + 1$

3. Take the elements of main diagonal $< d_1, ..., d_v >$. Build a permutation $\sigma_v = \{(d_1, 1), (d_2, 2), ..., (d_v, v)\}$.

4. Apply σ_v for all element of the *multiplication table*

As result you have a CI quasigroup.

Construction method of CI quasigroup of order 7

4	4	1	5	2	6	3	7

We apply $\sigma_v = \{(1,1),(3,2),(5,3),(7,4),(2,5),(4,6),(6,7)\}$ as result we have a idempotent commutative quasigroup of order v.

Bose construction($v \equiv 3 \bmod (6)$)

Let $v = 6n + 3$ and let $(Q, \circ)$ be an idempotent commutative quasigroup of order $2n + 1$, where $Q = \{1, 2, 3, ..., 2n + 1\}$. Let $S = Q \times \{1, 2, 3\}$ and define T to contain the following types of triples.

Type 1: For $1 \leq i \leq 2n + 1$, $\{(i, 1), (i, 2), (i, 3)\} \in T$

Type 2: For $1 \leq i < j \leq 2n + 1$, $\{\{(i, 1), (j, 1), (i \circ j, 2)\}, \{(i, 2), (j, 2), (i \circ j, 3)\} \{(i, 3), (j, 3), (i \circ j, 1)\}\} \in T$

Then (S, T) is a Steiner triple system of order $6n + 3$.
Type of partitions

Figure: Type 1

Figure: Type 2

Proof

$|T|$ is made up with 2 type:

- *Type 1*: $2n + 1$ triples
- *Type 2*: $\binom{2n+1}{2}$ choices for i and j, for all of them there are 3 another type.

Then $|T| = (2n+1) + 3\frac{(2n+1)2n}{2} = \frac{(2n+1)(6n+2)}{2} = v(v-1)/6$ have the right number of triple.

To show that every pairs is contained in at least 1 triple, think about 2 possible pair of point $(a, b), (c, d) \in Q \times \{1, 2, 3\}$:

Cont..

$\forall (a, b), (c, d) \in Q \times \{1, 2, 3\}$

- $a = c \wedge b = d$ impossible
- if $a = c$ (so $b \neq d$) is contained in at least 1 triple of *type 1*
  $\{(a, 1), (a, 2), (a, 3)\}$
- if $b = d \wedge a \neq c$ is contained in at least 1 triple of *type 2*
  $\{\{(a, b), (c, b), (a \circ c, b + 1 mod(3))\}, \{(x, 1), (a, 1), (b, 2)\}, ...\}$
- $a \neq c \wedge b \neq d$. Assume $b = 1$ and $d = 2$. Since $(Q, \circ)$ is a quasigroup
  $a \circ i = c$ and $j \circ a = c$ for some i, j. Because the *commutative* $i = j$
  and because *idempotent* only $a \circ a = a$, all the others we are sure
  that $i \neq a$. So $\{(a, 1), (i, 1), (a \circ i = c, 2)\}$.

All possible point have been shown that are in T.

Skolem construction ($v \equiv 3 mod(6)$)

Let $v = 6n + 1$ and let $(Q, \circ)$ be a half-idempotent commutative quasigroup of order $2n$, where ....

Half-idempotent commutative latin square

(Definition)Half-idempotent commutative latin square

A latin square (multiplication table of quasigroup of the same order) L of order $2n$ is *half-idempotent* if the cells (i, i) contain the same symbol i of the cell $(n + i, n + i)$ $\quad \forall 1 \leq i \leq n$

The bijection σ is built increasing all value by 1(or by taking the next element). Then by taking the main diagonal from the left grid ($<1, 3, 5, ... >$) and assign the right number ($<1, 2, 3, ... >$)

Example Skolem construction

Let $v = 6n + 1$ and let $(Q, \circ)$ be a half-idempotent commutative quasigroup of order $2n$, where $Q = \{1, 2, 3, ..., 2n\}$. Let $S = \{\infty\} \cup (Q \times \{1, 2, 3\})$. We define T as follow:
Type 1 : for $1 \leq i \leq n$, $\{(i, 1), (i, 2), (i, 3)\} \in T$

Type 2 : for $1 \leq i \leq n$, $\{\infty, (n + i, 3), (i, 2)\}, \{\infty, (n + i, 2), (n + i, 3)\}, \{\infty, (n + i, 3), (i, 1)\} \in T$

Type 3 : for $1 \leq i < j \leq 2n, \{(i, 1), (j, 1), (i \circ j, 2)\}, \{(i, 2), (j, 2), (i \circ j, 3)\}, \{\} \in T$

Example Skolem construction

Proof

We have to prove (in a similar way of Bose) there are the right number of $t \in T$ and every pair (from $\binom{6n+1}{2}$) is contained almost 1.

1: Right number of $|T|$.

We sum up 3 different element:

- *type 1*: for $1 \leq i \leq n$, $\{(i,1),(i,2),(i,3)\} \in T$ are n

- *type 2*: for $1 \leq i \leq n$,
  $\{\infty,(n+i,3),(i,2)\}, \{\infty,(n+i,2),(n+i,3)\}, \{\infty,(n+i,3),(i,1)\} \in T$
  are $3n$

- *type 3*: for
  $1 \leq i < j \leq 2n, \{(i,1),(j,1),(i \circ j,2)\}, \{(i,2),(j,2),(i \circ j,3)\}, \{\} \in T$ are
  $3\binom{2n}{2}$

We have to prove $|T| = \frac{v(v-1)}{6} = \frac{(6n+1)(6n)}{6} = n + n + 3\binom{2n}{2}$.
Easily
$n + 3n + 3\binom{2n}{2} = \frac{2n*4 + 2n*(6n-3)}{2} = \frac{2n(6n+1)}{2} = \frac{3}{3}\frac{2n(6n+1)}{2} = \frac{6n(6n+1)}{2} = |T| \qquad \square$

2: every pair of point $\in T$.

We have to prove all possible pair of point (a, b) and (c, d):

- $a = c = \infty \wedge b \neq d$
- $a = c \neq \infty \wedge b \neq d$
- $a = \infty \neq b \wedge b = d$
- $a \neq c \wedge b \neq d$

$\square$

2: every pair of point $\in T$.

We have to prove all possible pair of point (a, b) and (c, d):

- $a = c = \infty \wedge b \neq d$
- $a = c \neq \infty \wedge b \neq d$
- $a = \infty \neq b \wedge b = d$
- $a \neq c \wedge b \neq d$

$\square$

All covered by Skolem construction $\wedge$ $|T|$ is the right number $\Rightarrow$ is a STS($2n$)

Practical example

[1850] The Lady's and Gentleman's Diary/Kirkman's shoolgirl problem

A teacher would like to take 15 schoolgirls out for a walk, the girls being arranged in 5 rows of three. The teacher would like to ensure equal chances of friendship between any two girls. Hence it is desirable to find different row arrangements for the 7 days of the week such that any pair of girls walk in the same row exactly one day of the week.

[1850] The Lady's and Gentleman's Diary/Kirkman's shoolgirl problem

> *A teacher would like to take 15 schoolgirls out for a walk, the girls being arranged in 5 rows of three. The teacher would like to ensure equal chances of friendship between any two girls. Hence it is desirable to find different row arrangements for the 7 days of the week such that any pair of girls walk in the same row exactly one day of the week.*

Solution

[1971 (Ray-Chaudhuri and Wilson)] it asks for a Steiner Triple System on $6t + 3$ varieties whose blocks can be partitioned into $3t + 1$ sets so that any variety appears only once in a set.

Important remark

Theorem

If a $(v, k, \lambda) - BIBD$ exist, then $\lambda(v - 1) \equiv 0(mod(k - 1))$ and $\lambda v(v - 1) \equiv (mod k(k - 1))$.

Theorem

A STS of order v **exists** if and only if $v \equiv 1, 3\ mod(6)$

Theorem

If a $(v, k, \lambda) - BIBD$ exist, then $\lambda(v-1) \equiv 0(mod(k-1))$ and $\lambda v(v-1) \equiv (mod k(k-1))$.

Only **necessary**.

Theorem

A STS of order v **exists** *if and only if $v \equiv 1, 3 \ mod(6)$*

Necessary and **sufficient**.

Isomorphisms between two *design*

Isomorphism

Two designs (X, A) and (Y, B) where $|X| = |Y|$ are *isomorphic* if there *exists* a bijection $\alpha : X \to Y$ such that:

$$[\{\alpha(x) : x \in A\} : A \mathrm{A}] = \mathrm{B}$$

Then α is called isomorphism.

$$X = \{1, 2, 3, 4, 5, 6, 7\}, \quad \text{and}$$
$$\mathcal{A} = \{123, 145, 167, 246, 257, 347, 356\};$$

$$Y = \{a, b, c, d, e, f, g\}, \quad \text{and}$$
$$\mathcal{B} = \{abd, bce, cdf, deg, aef, bfg, acg\}.$$

Beyond Existence or non-existence

The existence of non-isomorphic STS is complex and a open field.

Fixed a design
$(S, T) \equiv (\{s_1, ..., s_{|S|}\}, \{t_1, ..., t_{|T|}\})$
let all elements $m_{i,j}$ of *incidence matrix* of a design (S, T) be:

$$m_{i,j} = \begin{cases} 1 & \text{if } s_i \in t_j \\ 0 & \text{if } s_i \notin t_j \end{cases}$$

The existence of non-isomorphic STS is complex and a open field.

The existence of non-isomorphic STS is complex and a open field.

(A030129) Number of nonisomorphic Steiner triple systems (STS's) $S(2, 3, n)$ on n points

$< 1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 2, 0, 80, 0, 0, 0, 11084874829 >$

(A051390) Number of nonisomorphic Steiner quadruple systems (SQS's) of order n

$< 1, 1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 4, 0, 1054163 >$

[1974 Wilson]Upper bound to non-isomorphic STS(v)
